Modelling and Forecasting

Conclusion

ennition

Bike-sharing systems are a means of renting bikes, through which people can rent a bike from any place and return it when they arrive at their destination. The bike-sharing system clearly records the time of travel, the place of departure, the place of arrival and the time. Therefore, it can be used to study mobility in cities. In this project, historical usage patterns were combined with weather data to predict bike rental demand in Washington, D.C.

- Researchers can use bike sharing systems as a sensor network, which can be used for studying mobility in a city.
- This is a Supervised regression machine learning task.
- The training set is comprised of the first 19 days of each month, while the test set is the 20th to the end of the month.

Modelling and Forecasting

Conclusion

■ there are two peaks in the graph, one is from 7-8 in the morning, the other is from 5-6 in the afternoon, which is the morning peak and the evening peak respectively, which is in line with the actual situation.

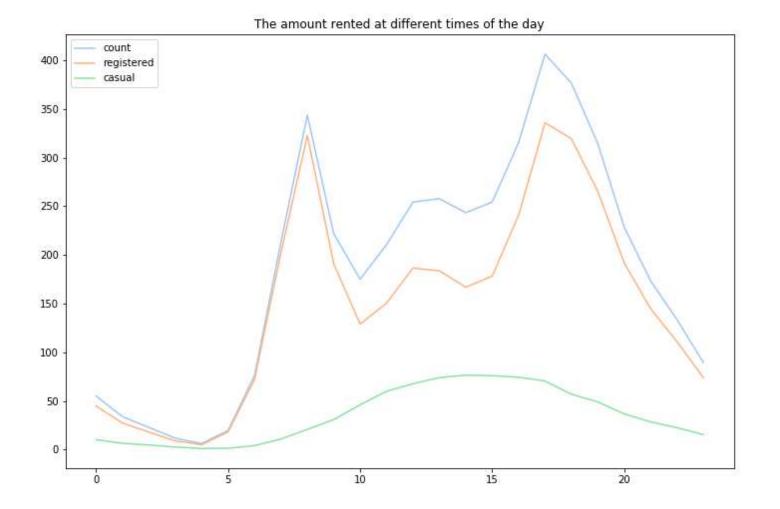

Figure 8: The amount rented at different times of the day

#### Time characteristic analysis

Weather characteristics analysis

Feature selection

Modelling and Forecasting

Conclusion

■ from Monday to Friday, 8 in the morning of the day - 9 am and 5 to 7 PM, usage is more, may be caused by time going to work in the morning and evening after work time, include the reason of eating out at the same time, for the weekend, time is more focused, basic usage around 11 PM to 5 PM, This time is supposed to be everyone's leisure time.

#### Time characteristic analysis

Weather characteristics analysis

Feature selection

Modelling and Forecasting

Conclusion

■ The usage is obviously lower in spring, probably due to the lower temperature.

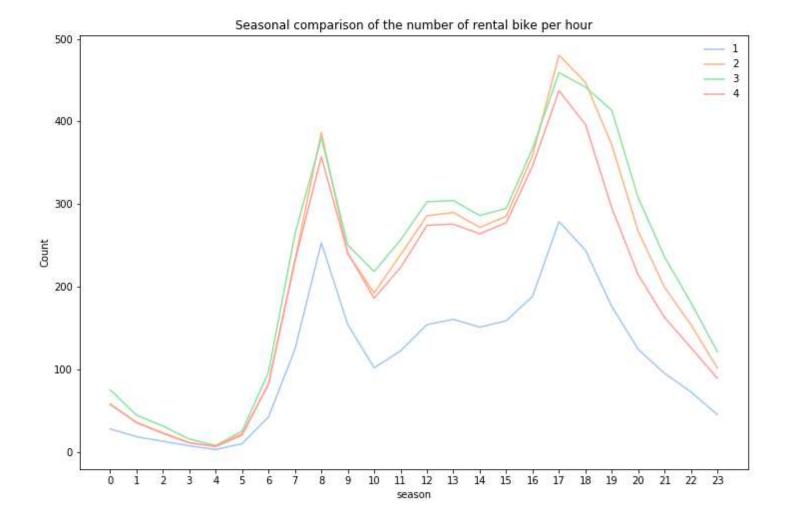

Figure 10: Seasonal comparison of the number of rental bike per hour

# Weather characteristics analysis

Data exploration

Data visualization

Time characteristic analysis

Weather characteristics analysis

Feature selection

Modelling and Forecasting

- Temperatures below 10 degrees, above 30 degrees, and fewer bike rentals too cold or too hot will damper rental demand.
- The higher the wind, the fewer bike renters high winds dampen rental demand.
- The higher the humidity in the air, the fewer people who hire bikes it's more comfortable to ride on dry days.

### Conclusion

Problem Definition

Data exploration

Data visualization

Feature selection

Modelling and Forecasting

Conclusion

- Cross-validation by grid search did not decrease the RMSE of the model and did not improve the accuracy of the model. The effect did not come up to expectations.
- The limitation of this study is that it does not consider whether there is overfitting of the model, and further experiments can be carried out in future studies.
